

Sanding paper

With different grain sizes (12, 16, 24, 36, 60, 80, 100, 120) the sanding paper pads are ideal for the refurbishment of wooden floors and offer a wide range of applications from restoration of old flooring to fine sanding before final surface treatment.

Sanding Paper

Directions for use

For particularly rough work (such as working on large, multi-layered and/or problematic surfaces or residues) that should result in high material removal, grinding with sand paper disks with a small grit, such as K16, 24 or 36, are suitable.

A medium removal rate is typically achieved with grit sizes in the range from 36 to 80. Possible applications are simple renovation work on furniture, also suitable for pre-sanding for painting work and sanding off excess joint filler on gipwall.

Grits from 100 upwards can be used for fine work with low abrasion.
